

The evaluation of the final project vs. the design proposal, highlighting any differences with justifications for any changes/ omissions.

As the system design happens before the system implementation, it is hard to estimate the implementation process. When coding starts and code segments are appeared, developers will need to change design document; The design of the system might even change significantly in the process of coding. This scenario happened to our project when we had to make slight changes to some part of our design. For example, the team decided to omit the event monitoring module because it was not compatible with the team members' skill and knowledge level.
